1 More Sampling Distributions

Theorem 1.1 (Central Limit Theorem). *Consider the independently identically distributed sample X_1, \dots, X_n with μ, σ^2 . Defining*

$$\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i$$

and

$$Z_n = \frac{\bar{X}_n - \mu}{\frac{\sigma}{\sqrt{n}}}$$

Then as $n \rightarrow \infty$, the distribution of Z_n tends to the normal distribution $n(z; 0, 1)$.

The standard deviation of \bar{X}_n is $\frac{\sigma}{\sqrt{n}}$, so the distribution of \bar{X}_n is $n(\bar{x}; \mu, \frac{\sigma^2}{n})$, and \bar{x}_n is the realisation of \bar{X}_n .

2 Sample Variance

$$S^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2$$

Recall the χ -squared distribution

$$f(y, \nu) = \begin{cases} \frac{1}{2^{\frac{\nu}{2}} \Gamma(\frac{\nu}{2})} y^{\frac{\nu}{2}-1} e^{-\frac{y}{2}} & y > 0 \\ 0 & , y \leq 0 \end{cases}$$

Then

$$\begin{aligned}\chi^2 &= \frac{n-1}{\sigma^2} S^2 \\ &= \frac{1}{\sigma^2} \sum_{i=1}^n (X_i - \bar{X})^2\end{aligned}$$

Then χ^2 has χ -squared distribution $\nu = n - 1$. ν is the number of degrees of freedom. For

$$\frac{1}{\sigma^2} \sum_{i=1}^n (X_i - \mu)^2$$

the probability density function is χ^2 with $\nu = n$.

3 T distribution

We let

$$T_n = \frac{\bar{X}_n - \mu}{\frac{S}{\sqrt{n}}}, S = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2}$$

If $n \geq 30$, $S \approx \sigma$, then we can use the Central Limit Theorem replacing the standard deviation with S .

Definition 3.1 (T Distribution).

$$H(t) = \frac{\Gamma\left(\frac{\nu+1}{2}\right)}{\Gamma\left(\frac{\nu}{2}\right) \sqrt{\pi\nu}} \left(1 + \frac{t^2}{\nu}\right)^{-\frac{\nu+1}{2}}$$

4 Comparison of T Distribution and Normal Distribution

The T distribution has "heavy tails", meaning it is more likely for there to be a value far from the mean. The T distribution can be used if there is a normal population, and the Central Limit Theorem ($\sigma = S$) can be used for non normal population given $n \geq 30$.

5 Comparison of T Distribution and Normal Distribution

The T distribution has "heavy tails", meaning it is more likely for there to be a value far from the mean. The T distribution can be used if there is a normal population, and the Central Limit Theorem ($\sigma = S$) can be used for non normal population given $n \geq 30$.

6 Comparison of T Distribution and Normal Distribution

The T distribution has "heavy tails", meaning it is more likely for there to be a value far from the mean. The T distribution can be used if there is a normal population, and the Central Limit Theorem ($\sigma = S$) can be used for non normal population given $n \geq 30$.

7 Comparison of T Distribution and Normal Distribution

The T distribution has "heavy tails", meaning it is more likely for there to be a value far from the mean. The T distribution can be used if there is a normal population, and the Central Limit Theorem ($\sigma = S$) can be used for non normal population given $n \geq 30$.
